

Low Pin Count (LPC) I/O Bridge

ABSTRACT

5 A low pin count (LPC) input/output (I/O) bridge device and method for a
portable computer having a plurality of legacy ports and a docking connector. The LPC
I/O bridge device includes an LPC controller coupled to the legacy ports and docking
connector. The LPC controller is adapted to detect whether the portable computer is
coupled to a docking station via the docking connector and route data transmissions to
10 the legacy ports, docking connector, or both, based on information received from an
LPC interface. Serialization logic coupled to the LPC controller serializes data
transmissions routed to the docking connector.
